

1. List vs Tuple

- 1. List is mutable, whereas Tuple is immutable.**
- 2. List uses square brackets [], whereas Tuple uses parentheses ().**
- 3. List has many built-in methods like append(), remove(), and sort(), whereas Tuple has only a few methods such as count() and index().**
- 4. List consumes more memory, whereas Tuple consumes less memory.**
- 5. List is preferred when data needs to be modified, whereas Tuple is preferred for fixed data.**

2. List vs Set

- 1. List is ordered, whereas Set is unordered.**
- 2. List allows duplicate values, whereas Set stores only unique values.**
- 3. List supports indexing, whereas Set does not support indexing.**
- 4. List uses square brackets [], whereas Set uses curly braces {}.**
- 5. List is used when order is important, whereas Set is used when unique values are required.**

3. Tuple vs Set

- 1. Tuple is ordered, whereas Set is unordered.**
- 2. Tuple is immutable, whereas Set is mutable.**
- 3. Tuple allows duplicate values, whereas Set does not allow duplicate values.**
- 4. Tuple supports indexing, whereas Set does not support indexing.**
- 5. Tuple uses parentheses (), whereas Set uses curly braces {}.**

4. Dictionary vs List

- 1. Dictionary stores data as key-value pairs, whereas List stores only values.**

2. **Dictionary elements are accessed using keys, whereas List elements are accessed using indexes.**
3. **Dictionary keys must be unique, whereas List can contain duplicate values.**
4. **Dictionary uses curly braces {}, whereas List uses square brackets [].**
5. **Dictionary is mainly used for fast data retrieval using keys, whereas List is used to store ordered collections of values.**

5. Dictionary vs Set

1. **Dictionary stores key-value pairs, whereas Set stores only unique values.**
2. **Dictionary contains keys and values, whereas Set contains only values.**
3. **Dictionary values are accessed using keys, whereas Set does not support keys or indexing.**
4. **Dictionary uses the format {key: value}, whereas Set uses {value1, value2}.**
5. **Dictionary is used to represent related data, whereas Set is mainly used to remove duplicates and store unique values.**
